

300mA, Ultra-low noise, Small Package **Ultra-Fast CMOS LDO Regulator**

General Description

The LP3992 is designed for portable RF and wireless applications with demanding performance and space requirements. The LP3992 performance is optimized for battery-powered systems to deliver ultra low noise and low guiescent current. The LP3992 also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications, critical in hand-held wireless devices. The LP3992 consumes less than 0.01µA in shutdown mode and has fast turn-on time less than 50µs. The other features include ultra low dropout voltage, high output accuracy, current limiting protection, and high ripple rejection ratio. It is available in the 5-lead of SOT23-5 and TSOT23-5 packages.

Order Information

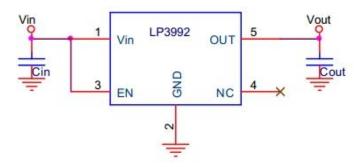

Features

- Ultra-Low-Noise for RF Application
- 2.5V- 5.5V Input Voltage Range
- Low Dropout: 220mV @ 300mA
- 1.2V, 1.5V, 1.8V, 2.5V, 2.8V, 3.0V, 3.3V, 3.6V and 5V Fixed
- 300mA Output Current
- High PSSR:-76dB at 1KHz
- < 0.01uA Standby Current When Shutdown
- Available in SOT23-5 and TSOT23-5 Package
- TTL-Logic-Controlled Shutdown Input
- Ultra-Fast Response in Line/Load transient
- Current Limiting and Thermal Shutdown Protection
- Quick start-up (typically 50uS)

Applications

- Portable Media Players/MP3 players
- Cellular and Smart mobile phone
- LCD
- **DSC Sensor**
- Wireless Card

Typical Application Circuit

LP3992-05

Applications Information

Like any low-dropout regulator, the external capacitors used with the LP3992 must be carefully selected for regulator stability and performance. Using a capacitor whose value is > 1µF on the LP3992 input and the amount of capacitance can be increased without limit. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response. The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application. The LP3992 is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least $1\mu F$ with ESR is > $25m\Omega$ on the LP3992 output ensures stability. The LP3992 still works well with output capacitor of other types due to the wide stable ESR range. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the VOUT pin of the LP3992 and returned to a clean analog ground.

Start-up Function Enable Function

The LP3992 features an LDO regulator enable/disable function. To assure the LDO regulator will switch on, the EN turn on control level must be greater than 1.4 volts. The LDO regulator will go into the shutdown mode when the voltage on the EN pin falls below 0.4 volts. For to protecting the system, the LP3992 have a quick-discharge function. If the enable function is not needed in a specific application, it may be tied to VIN to keep the LDO regulator in a continuously on state.

Thermal Considerations

Thermal protection limits power dissipation in LP3992. When the operation junction temperature exceeds 150°C, the OTP circuit starts the thermal shutdown function turn the pass element off. The pass element turns on again after the junction temperature cools by 25°C. For continue operation, do not exceed absolute maximum operation junction temperature 125°C.

The power dissipation definition in device is:

$$PD = (VIN-VOUT) \times IOUT + VIN \times IQ$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient.

The maximum power dissipation can be calculated by following formula:

$$PD(MAX) = (TJ(MAX) - TA)/\theta JA$$

Where TJ(MAX) is the maximum operation junction temperature 125°C, TA is the ambient temperature and the θJA is the junction to ambient thermal resistance. For recommended operating conditions specification of LP3992, where TJ(MAX) is the maximum junction temperature of the die (125°C) and TA is the maximum ambient temperature. The junction to ambient thermal resistance (θJA is layout dependent) for SOT23-5 package is 195°C/W.

$$PD(MAX) = (125^{\circ}C-25^{\circ}C) / 195 = 500 mW$$

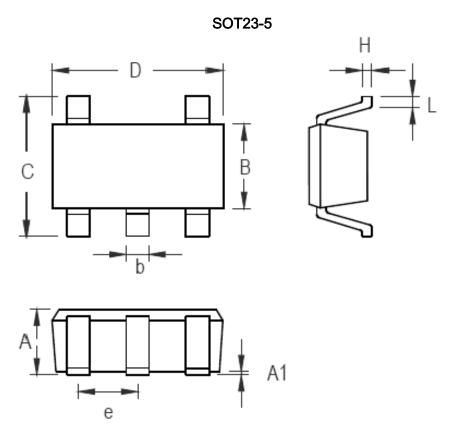

The maximum power dissipation depends on operating ambient temperature for fixed TJ(MAX) and thermal resistance θJA.
